Experience

Amazon Web Services December 2025 – Current

Software Dev Engineer II | Platform Build & Orchestration

- Launched the AL2023 generation of the Nebula AMI by migrating builds onto the Atomic build system; added full automation, eliminating 2 days of manual engineering effort per release and accelerating the delivery of security patches and kernel updates to 400,000 instances.

Software Dev Engineer | Apollo Data Plane July 2023 – December 2025

- Developed and maintained the deployment engine that executes ~4 million deployments per day to millions of hosts across all AWS partitions, powering Tier-1 services like S3, DDB, EC2, and Amazon Retail Website.
- Migrated authentication mechanism for our services to short-term credentials, allowing them to be built with zero manual actions during new region builds, eliminating 5 error-prone manual credential steps per region and speeding up each region launch by 2 weeks
- Built deployment services in 3 new isolated partitions with no public internet connection that require special steps to move artifacts into secure data centers, enabling AWS services to deploy; led the project to completion two weeks ahead of deadlines and secured billion-dollar government deals
- Led a complete modernization of a legacy import system across 7 services and 4 languages, eliminating previously unauthenticated API calls to 0, introducing 99.9% package availability by guaranteeing import to 2+ core regions, and unblocking deprecation of a 10-year-old legacy transport system, saving 1 million dollars per month in legacy infrastructure.

Software Dev Engineer Intern | Timestream Database June – September 2022

- Implemented bulk import support for JSON file type from S3 to Timestream, directly unblocking 5 customers. Expedited feature launch date by 2 months by owning the design, implementation and release.

MLH Fellowship January – April 2022

Solana Fellow

- Extended web3.js library usability by implementing missing RPC calls in TypeScript that allow reading, writing, and executing transactions from the Solana blockchain
- Allowed full stack dApps to be created in under one hour for new blockchain developers by creating a Vue dApp scaffold and adding tutorial code snippets to the Solana Cookbook

SAP September 2020 – May 2021

Agile Developer Intern

- Developed SAP Analytics Cloud frontend features in Typescript for enterprises such as Apple and Porsche
- Improved latency by 8% by finding and removing redundant SQL calls to SAP HANA backend
- Reduced testing time by 5 hours per week by automating frontend tests using Selenium

Education

University of British Columbia September 2018 - May 2023

Bachelor of Applied Science in Computer Engineering with Distinction

GPA: 4.00/4.33

Projects

BLM Tracker - *MLH Fellowship Orientation Hackathon finalist* June 2020

- Created a dynamic heatmap webapp showing areas in the US with the most active BLM movement using Python, MongoDB database, Keras, TensorFlow, and Flask

Custom Operating System (OS161) December 2021

- Implemented critical kernel infrastructure in a teaching operating system, including synchronization primitives, processes and file tables, system calls and virtual memory in C
